LLM

An LLM (Large Language Model) in AI is a powerful deep learning model trained on massive amounts of text and data to understand, generate, and process human language, performing tasks like:

- ❓ Answering questions
- 📄 Summarizing
- 🌐 Translating
- </> Writing code

LLM PARAMETERS

LLM parameters are the internal, numerical values (weights and biases) a large language model learns during training, determining its knowledge and behavior, with more parameters generally meaning more complexity and capability.

 Each LLM has different amount of parameters

LLM TOOLS

LLM tools enable large language models to interact with external systems, APIs, and data, moving beyond text generation to actionable, real-world tasks

RAG

Retrieval-Augmented Generation. A powerful AI technique that enhances Large Language Models (LLMs) by letting them access and use external, up-to-date data like company documents.
